99	Miscellaneous	Source is <u>neither</u> SKYMAP 3.7 <u>nor</u> identified

#### NOTES

( ) original sources of data included via SKYMAP Master Catalog (MC) Version 3.7 are identified;

[ ] sources added for SKYMAP MC Ver 4.0;

< > sources added for MC Ver 4.0a;

{ } added for SKY2000 MC Ver 1;

+ + added for SKY2000 Ver 2.

Remaining sources were added for SKY2000 Vers 3, 4 or 5.

While helpful for cross ID checks, no other data from these sources are present in SKY2000 Ver 2:

5, 8, 12-14, 34, 37, 40-42, 46, 49, 53, 57, 59-61, 69, 81, 90, 97. An exception is 22 [Russian 'R' enters via 27(CRM)].

In addition to those not present in Ver 2, the following sources provided no data in Vers 5: 0-1, 5, 8, 12-14, 32, 36-38, 40-42, 44-46, 49, 51, 53, 59-62, 69, 94-95, 97. An exception is 22 [Russian 'R' enters via 27(CRM)].

Specific types of data from the following sources were reintroduced directly from the original catalogs instead of via SKYMAP Ver 3.7: 2, 16, 19, 28, 29, 30, 35.

#### NOTES

\* MK spectral types from source 2 (HD/HDE): These catalogs did not contain MK spectral types, but in some cases composite spectra stars were represented by two entries in the HD/HDE. If they have not yet been separated adequately, these stars are represented by single entries in the MC, with combined spectral types that do not fit into the MC HD spectral type field. These "MK" entries should be distinguishable by the absence of luminosity class information and a plus sign indicating a combined spectrum.

\*\* HD spectral type from source 11 (GCRV): This catalog probably did not contain spectral types, so the source code given for the HD type in this MC entry is likely in error.

\*\*\* Johnson V magnitude from source 34 (IRS): This catalog contained photographic magnitudes, not V's, so the source code given for these data in the MC is likely in error, or the value is in the wrong MC field.

† MK type from source 35 (HDE Charts): This case is probably similar to the cases described in the first note in this section.

†† Radial velocities from sources 66 and 67 (Hipparcos Main and Component catalogs): The Hipparcos satellite did not measure RV, so all values in these catalogs were from external sources. The MC source codes should probably be 33 for these RV entries.

Catalogs with common names coded in orange: These catalogs are unidentified at the present time.

Catalogs with common names coded in yellow: Data from these sources are highly suspect. In the case of source code 96 HD spectral types, any truly correct data should have been replaced when the MC was updated from the original HD/HDE/SAO catalogs. Remaining data are probably incorrect. In the case of the source 98 MK spectral types, some types in MC Version 3.7 were generated from other data by software, a practice since discontinued for data to be included in the MC. In other cases, correct types were drawn from sources that were not clearly attributed.
